

In this laboratory activity, I built a web page layout featuring a navigation bar, an image carousel, service cards, and a dark footer using HTML and CSS. My main struggle was getting the image files to connect properly in my code because of file path issues. This resulted in broken image icons showing up in my carousel and cards instead of the actual photos. On top of that, I kept making small errors like minor typos and class name mistakes that messed up the styling. Debugging these issues step-by-step really taught me to be more careful with my file links and pay closer attention to detail when coding, especially since in my phone pic is not working.
