

In this laboratory activity, I worked on our IT112 Week 7 FullStackStarter mini app to build an "Add User" form and a dynamic "User List" section running on localhost:3000. I struggle a lot in localhost phase, i encounter so many errors and there's a time that i miss the standard name that's why file name is not called by the code. It was really frustrating at first to sit there trying to figure out why things weren't connecting or loading properly. Working through those errors step-by-step really showed me how even a small typo or wrong file name can break the whole app. In the end, seeing the form finally accept entries and display them live on the user list made all the troubleshooting effort feel super rewarding.
